Feasibility Study Overview

- History of County Ditch 16
- Design criteria and flood-risk mitigation goals
- Alternatives evaluated
- Recommended Alternative

**Question for the Board**

Will Board authorize District and Barr staff to proceed with final design of Alternative 4 – a gravity outlet at 872.2? This would include

- Continued coordination with MnDOT and Little Canada
- Coordination with property owner
- Prepare final plans, specifications, and operating plan
Design Criteria & Flood-Risk Mitigation Goals

• Design Criteria
  – No increase in the 2-, 10-, or 100-year peak discharge
  – No increase in downstream flood elevations
  – Implement erosion and sediment controls
  – Avoid, minimize, and mitigate wetland impacts
  – Maintain minimum offset from petroleum pipeline

• Flood-Risk Mitigation Goals
  – Minimize frequency and duration of inundation
  – Maximize freeboard
  – Minimize upland impacts
  – Provide flexibility for future optimization
Flood-Risk Mitigation Alternatives

- High-level screening
  - Lift station
  - Lowering embankment
  - Gravity outlet with no gate

- Feasibility Evaluation
  - Alternative 1: Remove Flood-Prone Structure
  - Alternative 2: Emergency Response Plan
  - Alternative 3: Gravity outlet at Elevation 874.0
  - Alternative 4: Gravity outlet at Elevation 872.2
Alternative 4: Gravity Outlet at 872.2

- Grade ditch to embankment
- Gravity pipe through embankment
- Gate
- Access & drainage easement acquisition
- Wetland mitigation
- Operation plan
- Estimated 30-year cost $214,000 – $401,000
# Alternative Summary

<th>Permitting Authority</th>
</tr>
</thead>
<tbody>
<tr>
<td>No increase in peak runoff rate during 2-year, 10-year, or 100-year event</td>
<td>RWMWD – Rule C</td>
</tr>
<tr>
<td></td>
<td>MnDOT</td>
</tr>
<tr>
<td>No increase in downstream flood elevations</td>
<td>RWMWD – Rule D</td>
</tr>
<tr>
<td>Implement erosion and sediment controls</td>
<td>RWMWD – Rule E</td>
</tr>
<tr>
<td></td>
<td>City of Little Canada – Fill Permit</td>
</tr>
<tr>
<td></td>
<td>MPCA – NPDES Permit</td>
</tr>
<tr>
<td>Avoid, minimize, and mitigate wetland impacts</td>
<td>RWMWD – Rule F</td>
</tr>
<tr>
<td>Minimum 2-foot vertical offset from pipeline for pipes</td>
<td>BP</td>
</tr>
<tr>
<td>Minimum 4-foot vertical offset from pipeline for drainage ditches</td>
<td>BP</td>
</tr>
<tr>
<td>Pump or actively manage discharge</td>
<td>MDNR</td>
</tr>
</tbody>
</table>

### Design Goal Notes

Maximize freeboard board between low home and 100-year water level
Minimize the frequency and duration of inundation on residential property
Minimize impacts to upland area
Provide flexibility for future optimization

Design goals are secondary objectives that a system modification should achieve after meeting the minimum design criteria summarized in Section 3.

| Engineer’s opinion of probable cost over a 30-year period                       | $878,000 - $1,648,000                      |
| $1,097,000                                                                       |
| $344,000 - $568,000                                                             |
| $413,000                                                                         |
| $190,000                                                                         |
| $214,000 - $401,000                                                             |
| $267,000                                                                         |

Notes:
1. If operation plan is developed for when temporary pump can be operated or gate can be opened. There may be periods when the pump is turned off or gate is closed to avoid increase to the peak discharge rate.
2. Discharging any additional flow downstream changes flood-risk: alternative 1 is the only alternative that does not change downstream flood-risk. Alternative 2 and 3 result in increases to the 100-year floodplain in the Phalen Chain and would require downstream modifications to mitigate impacts to the 100-year flood elevation. Alternative 4 includes an operating plan to reduce the potential to downstream impacts to the 100-year floodplain. Adherence to the operating plan that is consistent with permitting requirements and hydrologic modeling will reduce that risk.
3. Wetland impacts must be minimized during final design. Alternative 3 and Alternative 4 may have opportunity for wetland enhancement and ecosystem restoration for a wetland adjacent to agricultural fields.
4. MDNR appropriation permit is required prior to activating Alternative 2 temporary pump. An appropriation permit may not be required for Alternative 3 if operable gates are removed from the design. A long-term appropriation permit may be obtained for permanent outlet included in Alternative 4.
5. Alternative 1 removes the low home.
6. Alternative 1 does not reduce inundation duration. Alternative 2 only reduces the duration that inundation extends onto residential property when the water levels trigger implementation of emergency response measures. Alternative 3 does not reduce inundation duration for water levels below 874.0.
7. Alternative 1 disturbs the most upland area, including relocation of existing home.
8. Alternatives 1, 2, and 3 do not include permanent modifications that allow for flexibility to modify future management of lake levels. Alternative 4 would allow the outlet elevation to be increased in the future.
Alternative 1: Remove Flood-Prone Structure

- Hazardous substance abatement
- Property acquisition
- Removal or relocation of structures
- Operation plan
- Estimated 30-year cost $848,000 – $1,646,000
Alternative 2: Emergency Response Plan

- Operation plan
- Coordination with City
- Access & easement acquisition
- Estimated 30-year cost $344,000 – $646,000
Alternative 3: Gravity Outlet at 874.0

- Grade ditch to embankment
- Gravity pipe through embankment
- Gate
- Access & easement acquisition
- Operation plan
- Estimated 30-year cost $153,000 – $285,000
Brief History of County Ditch 16 downstream of Twin Lake

1918: County Ditch 16 established
1947: Dubuque-Twin Cities petroleum pipeline constructed
Mid-1960’s: I-694 constructed
1966: profile of County Ditch 16
1975: RWMWD formed
1983: RWMWD takes over jurisdiction of county ditch system within RWMWD
1993: RWMWD completes Twin Lake hydrologic study
2005: Unweave-the-weave
2018: RWMWD receives request from Little Canada to review Twin Lake water levels
2019: West Vadnais overflows
